ETS1 Example Problem A simple example problem was devised to demonstrate that the ETS1 Package correctly calculates evapo-transpiration when the relation of evapotranspiration rate to head is segmented. For this problem a grid of 11 rows by 11 columns in one layer was used to simulate an unconned aquifer with a uniform base elevation of 0 ft. All row and column widths were 100 ft. All cells in column 1 had a specied head of 50 ft, and all cells in column 11 had a specied head of 100 ft. Hydraulic conductivity of the aquifer material was 0. 05 ft d, and the system was modeled in steady state. Evapotranspiration was the only stress, and it was simulated with the ETS1 Package for one simulation and with the EVT Package (Harbaugh and others, 2000) for a second simulation. The input les for these simulations are listed in Appendix A. A two-segment function was assumed to relate evapotranspiration rate to head for both simulations (g. 4). The ET surface for the modeled area was dened as 100 ft, and the maximum evapotranspiration rate at the ET 2 surface was 0. 01 ft d. Each cell in the model had an area of 10, 000 ft, so the maximum evapotranspiration rate 3 over the area of one cell was 100 ft d. Segment 1 applies where the head is between 82 and 100 ft, and segment 2 applies where the head is between 64 and 82 ft. The two segments intersect at a depth below the ET surface of 18 ft, which corresponds to an elevation of 82 ft. At the...
