The loading configuration used a span-to-depth ratio of 6: 0 with a symmetric two-point loading configuration, as recommended by Yeh (1997). Two loading points were used so that localized crushing would not occur under a single load-point; how-ever, the loading points were spaced close together so that the test setup would closely simulate a center-point-loaded configuration. Although not necessary for development of design values, we measured the full-span deflection of these beams with respect to the neutral axis. These data, along with long-span and shear-free deflections measured on other beams, will provide useful information on the effect of shear deformation when modeling glulam MOE using lumber MOE values. Tension Tests Unique to this study was the utilization of a large-capacity Figure 10 - Edgewise bending test of 13-lamination tension machine (Fig. 13), with a 200, 000-lb load cell, to glulam beam. 11 This item ships from La Vergne,TN.
